Abstract (en)

[origin: WO9002258A1] A device for regulating an operating parameter of an internal combustion engine is disclosed. During the transition from idle running state to running state, fuel dosing is influenced in order to limit the speed of rotation according to a predetermined time function. This limitation of the speed of rotation is in particular activated in case of defects in the regulating system, in its control and feedback and when a dangerous variation of the speed of rotation occurs in the idle running state.
