Abstract (en)
[origin: EP0384215A1] A sliding door (10) for showers, having a plurality of sliding door leaves (11, 12 and 13), which are displaceable along an upper guide rail (14), is to be designed in such a way that the sliding door leaves (11-13) can be swivelled in a simple manner from their vertical position of use into an oblique position. For this purpose, the guide rail (14) is produced from a cross-sectionally circular profile and is at least partially overlapped by guide devices (16) connected to the sliding door leaves (11-13). At the upper end of a vertical beam (17) of a central sliding door leaf (12), an extending arm (19) is attached to a running roller (20) which is guided in a guide groove (15) of the guide rail (14) and is mounted in a floating manner on the free end of the extending arm (19). <IMAGE>
