Abstract (en)
[origin: EP0384218A1] The invention describes a sliding door (10) for showers, which has a frame and a plurality of sliding door leaves (11, 12, 13). The sliding door leaves (11, 12, 13), which are guided displaceably on the upper beam (15) of the frame, are all set obliquely relative to the longitudinal axis of displacement determined by the upper beam (15), such that only a small dimension results in relation to the transverse dimensions of the entire package of sliding door leaves (11 to 13) which have been pushed together. The overall design can thus be of relatively small and delicate construction. The frame profiles can be of correspondingly small dimensions without the risk of the sliding door leaves (11 to 13) projecting laterally beyond these frame profiles. <IMAGE>
