Abstract (en)
[origin: EP0384224A1] A guiding device for a door element (14, 16), in particular a shower partition, contains in the region of the lower edge of the door element a guide element (10, 12), whose rotary body (34) is in engagement with a guide groove (8) of a guide rail (2). This guiding arrangement is to be further developed with little constructional outlay to the effect that the guide element (10, 12) is removable from the guide rail when required. It is proposed to mount the rotary body (34) at least partially in a recess (35) of a holding body (32) so as to be rotatable about an axis (36) of rotation which is essentially orthogonal to the plane of the door element (14, 16) and to provide it with an actuating element which is preferably constructed as a handle (40). Said rotary body (34) has a pin (38) which is in engagement with the guide rail (2) or is rotated out of said guide rail, in accordance with the rotational position. <IMAGE>
