Abstract (en)
[origin: EP0384237A1] A vessel's hull for container or other cargo ships is described, the lateral main longitudinal bracings of which are connected to one another by transverse bracings between in each case two cargo holds or hatch openings, and the cargo holds of which are defined at the top by continuous longitudinal coamings. The transverse bracings each have two vertically spaced transverse members, of which in each case the top transverse member is attached to the longitudinal coamings at least mainly above the main longitudinal bracings of the hull, and in each case the transverse member running below it is attached to the main longitudinal bracings of the hull in an area of lower longitudinal bending stress of the hull. <IMAGE>
