Abstract (en)

Disclosed is a method for processing a light-sensitive silver halide color photographic material comprising processing the light-sensitive silver halide color photographic material, which comprises a support and silver halide emulsion layers which are respectively blue-sensitive, green-sensitive or red-sensitive and are provided on the support, the material has a DIR compound, and at least one of the blue-, green- and red-sensitive silver halide emulsion layers have a single layer constitution, within a color developing time of 120 seconds. According to the present invention, a method for processing a light-sensitive color photographic material suitable for full color photographing can be conducted.
