Abstract (en)

[origin: EP0385070A1] The security of a telecontrol system based on wireless code transmission by means of one or more independent transmitters to a receiver and applicable to any objects, particularly to centrally lockable motor vehicles, is enhanced in that an invariable code component which is transmitted together with a code component, which is a variable in accordance with a predetermined algorithm, during each code transmission, is object-specifically stored both in each transmitter and in the object-fixed receiver. A synchronising process between a transmitter and the receiver which, in any case, can only be carried out as a function of a mechanical code restriction, is possible only when the individual object-specific code component of the respective transmitter is stored in the receiver and can be called up. <IMAGE>
