Abstract (en)

[origin: EP0385234A2] The tickets (H) are stacked on each other within a magazine (M) in the lower portion of which a device (28) operates reciprocatingly, said device being provided with pointed teeth (128) which "bite" into the lower face of the lowest ticket in the stack and move it partially out of the magazine and of a slot (39) provided in the front portion of the dispenser. This device is carried by a pivotable lever (33) which is operatively connected to a drum-shaped cam (38) which, in turn, is keyed on the shaft of the unidirectional rotation apparatus (A) which may be activated by the user only when a coin or token (X) is received therein after being checked by the components of a conventional token-machine.
