Abstract (en)

[origin: EP0386478A1] For the stocking of spaces or containers with articles of different dimensions, a computer-aided control unit is proposed, with which automatic positioning of the articles depending upon their respective size can be carried out in the space. For the stocking of transport trains or ships with vehicles, a length measurement sensor is provided, which measures the length and possibly also the width of the vehicle and conveys these to a computer which processes the signals and drives optical display devices for the driver of the respective vehicle to be driven in. <IMAGE>
