Abstract (en)

A method of analyzing a solution eluted from a metal pickled and an apparatus for the same are provided. A reagent is added to the solution to analyze a temperature titration and a change of ionic dissociations of reaction products. A temperature and an electrical conductivity of the solution during the reaction are measured to obtain a differential temperature curve and an electrical conductivity curve. The pseudoequivalent points of the reactions of the respective dissolved substances are determined from the differential temperature curve and kinds of the substances are identified from peak values of measured values on the electrical conductivity curve.
