Abstract (en)

[origin: EP0386785A1] A gain adjuster for a color camera of sequential system which outputs from an image pick-up unit (3) an image signal sequentially including three kinds of color signals for each frame includes a group of gain setting elements (22) provided with a bit number of gain setting elements having a value corresponding to the bit weighting of a digital signal, a group of switches (24) provided with a plurality of analog switches for selectively parallel-connecting the gain setting elements (22) in the group of gain setting elements, an amplifying circuit (20) for amplifying the image signal from the image pick-up unit (3) by the combined gain of the group of gain setting elements selectively connected together by the group of switches, and a digital control unit (26) for outputting to the group of switches (24) a digital control signal corresponding to an amplification gain fit for each of the color signals in synchronism with the three kinds of color signals output from the image pick-up unit and time-division-controlling the amplification gain.
