Abstract (en)

The method is essentially characterised by appropriate vertical and horizontal displacements of certain assemblies (I1-I2), (I3-I4) of climbing brackets (2) and of their formwork and concrete work decking (P1, P2, P3), so as to temporarily and vertically align the brackets (2, 2b) two by two and thus to reduce the number of peripheral recesses to be provided in the floors to be laid in places inside the wall of the shell to be erected. <??>The installation is essentially characterised by the presence of lateral transfer carriages (14, 14') suitable for carrying out the horizontal transfers of the brackets, their vertical transfers being provided by the normal climbing system. <IMAGE>
