Abstract (en)

[origin: EP0388707A2] In a twin-axle railway goods car, in particular in a car with sliding sides, it is provided that the two head parts of the car each have a longitudinal section (1) with a width (B1) which is reduced in comparison with the width (B2) of the central car section (2). As a result, a transport facility with an extremely large area is available which, despite its considerable length and width, has car clearance corresponding to the regulations. <IMAGE>
