Abstract (en)
A door or window comprises a frame 11 defining two openings 12 and 13, one above the other, and two panels 15 and 14 for closing respective openings. One of the panels 15 is slidable from a position in which it closes its respective opening 12 to a position in which it overlaps the other panel 14 and an insect screen 16 extends across this latter opening to prevent insects gaining entry to a building when the one panel is in an open position. The panels 14 and 15 may be light transmitting panels.
