Abstract (en)
[origin: WO8904907A1] Protection device (5) for a panel (1) which is movable with respect to a frame (3, 4) comprising two sections (6, 7) each having at least two longitudinal strips. Always one of said sections (7) can be connected with one longitudinal strip (10) to the frame (4) whereas the other (6) can be connected with a longitudinal strip (8) to the panel (1) whilst the other longitudinal strips (9, 11) are free. The longitudinal strips (8, 9) of the first section (6) extend at an angle with respect to each other such that in the closed position of the panel (1) they cover adjacent areas of frame (4) and panel (1) extending at the same angle, and in which one of the longitudinal strips (8) can be connected to the area covered by it whilst the free longitudinal strip (11) of the second section (7) extends at a distance parallel to the other area such that in the closed position of the panel (1) it covers the free longitudinal strip (9) of the other section (6).
