Abstract (en)

[origin: EP0389827A2] The invention relates to a sheet output in rotary printing machines, in which the supplied sheets are deposited on a lowerable delivery table to form a sheet stack, having a bar grate, as the intermediate stacking means, which can be pushed in when the sheet stack is full and, in the pushed-in state, rests with its front free end on a support, so that the operation can be carried out without problems even during non-stop operation with a pallet. <IMAGE>
