Abstract (en)
[origin: EP0391129A2] For rewinding the warp (2) wound on the drum (1) of a warping frame onto the winding beam (4) of an adjacent beaming machine, a warp-clamping rod (14) holding the yarn ends of the warp (2) together during the transfer of the warp (2) from the warping drum (1) to the winding beam (4) of the beaming machine is used. So that the warp-clamping rod (14) can be moved from the warping drum (1) towards the winding beam (4) as simply and safely as possible, there is a motor-drivable conveyor device, to which the warp-clamping rod (14) is to be temporarily attached. This conveyor device advantageously possesses two endlessly rotating conveyor bands (10), arranged parallel to one another and to the warp yarns, and suspension hooks (13) provided on these bands and intended for the warp-clamping rod (14) to be suspended between them at its ends. <IMAGE>
