Abstract (en)

[origin: EP0391340A1] The invention relates to a method and a device for cleaning workpieces, in particular vehicle windows (2), in order to prepare them for subsequent treatment processes such as coating with adhesive etc. The cleaning process (1) contains a wiping element in the form of a cleaning belt (10) which is moved in relation to the workpiece (2). The cleaning belt is guided in a loop (12) between two spools (13,14) and brought into contact with the workpiece (2), the cleaning belt (10) being unwound in sections and in clocked fashion between or during the cleaning processes. For this purpose, an additional loop (44) is formed in the region of the loop (12) and fresh belt material is thereby pulled off the supply spool (13). Subsequently, the additional loop (44) is reformed, the used belt material is transported to the used material spool (14). <IMAGE>
