Abstract (en)

[origin: EP0392208A2] In order to provide a container (1), which is operationally reliable in handling and can be produced economically, in the form of a tube or bottle with a neck (2), in whose end face (9) the removal opening (3) is arranged, which can be closed by a lid (5) which is held against its seat in the closed position by a restoring element arranged in the interior of the container (1), the restoring element being constructed in such a way that its force is less than a force caused by a pressing-on pressure exerted on the contents of the container, the lid (5), being axially movable and constructed in a conical shape or in the shape of a calotte shell, is arranged in a correspondingly shaped seat in the end face (9) of the removal opening and the restoring element is constructed as a spring (4) which is connected to the lid (5) via a pulling element (8). <IMAGE>
