Abstract (en)
[origin: WO8905682A1] An image generating system has a generally horizontally disposed stage area (S) and, adjacent the stage area, a viewing area (V) in which members of an audience (M) can be accommodated for viewing images on the stage area. The viewing area is adjacent and extends away from a front region (132) of the stage area such that the members can view said images in a viewing direction extending from the front region to a back region of the stage area. The system further includes at least one image generating means (126) operable to generate an image (128) which is perceived from said viewing area as being located rearwardly of the stage area, beyond the back region thereof. Also the system has an upwardly extending light reflective panel (130) mounted across the back region of the stage area, the image generated by said at least one image generating means being generated such that it is reflected by said panel means towards the viewing area and thereby is perceived from said viewing area as located rearwardly of said stage area.
