Abstract (en)

[origin: US5068960A] A device for the insertion of filling wires into a wire jointed-band is described, being positioned in the conveying direction of a machine for the production of the wire jointed-band behind a feeding device for the plugging wires. By means of a guiding plate with channels and a roller the filling wires are inserted into the respective openings of the already completed wire jointed-band. The device according to the invention allows a sectional mechanical insertion of the filling wires into the actual wire jointed-band. The filling wires can be inserted simultaneously with the plugging wires, resulting in a substantially higher production speed.
