Abstract (en)

[origin: EP0393330A1] In the process the drive to a spinning frame enables the cops to be wound at a higher speed in the middle section, when control over the ring-rail enables the lift to be in short steps at the required period. The appts. is also claimed. The motor drives the gearbox, which has forward or reverse transmission control and lineshafts to both sides of the frame, with traversing drives to the ring-rails.
