Abstract (en)
[origin: EP0393448A1] A shoring apparatus for retaining trenches is described. The shoring apparatus has shoring plates (2) supporting the side walls of the trench, vertical supports (1) holding the shoring plates, and at least one spindle or stay for supporting two supports (1) arranged opposite one another. In the installed state of the shoring apparatus, the two spindle feet (5) are pressed with their front ends against the associated supports (1). These front ends (6) of the spindle feet (5) are of curved design in the vertical plane so that they can roll on the supports (1) when the shoring apparatus is lowered. <IMAGE>
