Abstract (en)  
This apparatus comprises a depilating head (1) comprising a series of movable blades (7) forming a plurality of clamps for grasping and uprooting the hairs to be removed. This depilating head is coupled to mechanical drive means capable of imparting to it on the one hand a movement of translation approximately in a plane (X-X') parallel to that defined by the free edges of the mobile blades (7) forming the gripping clamps, and along an axis parallel to the same edges, and on the other hand during this movement of translation a movement of withdrawal with respect to this plane, along an axis (Z-Z') perpendicular to the latter. Furthermore, means of actuating the mobile gripping blades (7) are provided to ensure the closure of the corresponding clamps before the withdrawal movement of the depilating head, and then opening them again until their next closure before a new withdrawal of the depilating head. <??>This apparatus is intended to be used for depilating unwanted hairs. <IMAGE>
