Abstract (en)

[origin: WO8808893A1] In a process for smooth feed of elastic thread to the knitting system of a circular knitting machine having a thread feed device controlled by an electronic control unit, the position signals (P) are counted on the basis of a reference signal (A) and the stop signal (S) is produced only for a predetermined number of position signals, or the reference signal (A) is ignored during a predetermined time-interval ( DELTA t) and the stop signal (S) is produced when this time-interval has elapsed, the predetermination being effected in function of the quality of the thread and/or the distance between the thread feed device and the knitting system. In this way, a subsequent feed is obtained which permits the tension of the elastic thread to be released. The circular knitting machine (1) contains a delay circuit (19) for the stop signal (S) in the electronic control unit (3) of the thread feed device (2).
