Abstract (en)

[origin: EP0394681A2] In the regulation of the ink supply according to colorimetric or densitometric parameters, process-related influences for optimum adaptation to the printing process and to the colour sensitivity of the human eye should not be left unconsidered during printing. <??>For single-colour and multi-colour regulation, methods are therefore proposed which actuate an intended location (Soll) considering the independent boundary conditions - maximum permissible tonal value increase(s) and maximum permissible ink film thickness(s), which intended location is situated both within the tolerable tonal value increase(s) ($Z_{Soll} +/- Z_{Tol}$ or $Z_{Solli} +/- Z_{Toli}$) and within the colour tolerance (E_{Tol}) or density tolerance (DV_{Tol}) or within the tolerance area ($TolR$). If the intended location ($Soll1$) does not fulfil these two independent boundary conditions simultaneously, the tolerance range of the tonal value increase(s) is widened and an intended location ($Soll2$ or Opt) is checked to establish whether it now obeys both boundary conditions simultaneously.
