Abstract (en)

A transport container for grain and the like has a covering in the form of a pair of roller tarpaulins (7), the "edge laths" of which are constituted by a pair of blowing-in tubes (2) with inlet stubs (3). By means of an actuating mechanism (9), possibly controlled by sensors (not shown) below the blowing-in tubes (2), these tubes may be moved during the filling-in operation in such a manner, that the optimal filling degree is achieved. The roller tarpaulins (7) may be rolled on to rolling-up tubes (8), moveable together with the blowing-in tubes (2) by means of the actuating mechanism (9) in such a manner, that the roller tarpaulin (7) is held in tension between the blowing-in tubes (2) and the rolling-tubes (8). During transport, those hoses or tubes (not shown), which are connected to the inlet stubs (3) during the blowing-in operation, may be placed inside the rolling-up tubes (8), the latter for this purpose being provided with removable covers (10).
