Abstract (en)

The invention relates to a container (1) intended for the retention of the decomposition liquids of a corpse and comprising lateral walls (4a, 4b, 4c, 4d) and a base plate (3) designed in such a way as to present, in alternation, longitudinal ribs (5) and longitudinal cavities (6), the said cavities containing a high-absorbency material and being covered by a grid (11). The absorbent material immobilises the decomposition liquids, and the container (1), preferably made of ABS, can be incinerated together with the grid (11) and the high-absorbency material after use. The container (1) is placed under the coffin or inside the coffin.
