Abstract (en)

This device for conveying cars consists of a first moving guide (7) supported by a series of fixed brackets (8) adjacent and parallel to one of the longer sides of a lift (3), and a second moving guide (9) braced by a twist-resistant tube, the same length as the first moving guide (7) and running on it by means of a first carriage (11) moving along the second moving guide (9). A second carriage (15) runs along the second moving guide (9), supporting a plate (13) with a pair of idler rollers (14) with horizontal axes pivoting on it. The second guide (9) with the carriage (15) running inside it, has first and second chain drive means (12 and 21), enabling the second guide (9) to appear alternately on each of the shorter sides of the lift (3), and enabling the plate (13) to move freely; the rollers (14) are controlled by means (20) causing them to move between the hold and release position on a wheel (2a) of the car (2).
