Abstract (en)
[origin: EP0396808A1] In this terminal row arrangement, the row terminals within the arrangement in each case have at least one busbar (4), provided with a hole (4a) and a lateral connector is guided over the terminal row, which lateral connector consists of a lateral strip (6) onto which a flat connector (7), which is separated from the lateral strip (6) and is constructed as an isolating connector, can be plugged for each terminal, which is to be connected to this potential, within the row, which flat connector (7) is also in this case plugged into the hole (4a) of the relevant busbar (4). Because of this design, the lateral connector provided for voltage and current distribution within the row also has an isolating function. The connected terminals within the row can be separated, for example for test purposes, by withdrawing the flat connector from the circuit without this influencing the other terminals within the row. <IMAGE>
