Abstract (en)

A hinge, particularly for the side doors of motor vehicles, comprises a forked element (2) and a flanged element (1) which are articulated to each other by an articulation pin (10) having a conical coupling surface (9) which engages a complementary conical surface carried by one prong (5) of the forked element, and has releasable clamping and retaining means (13) which are associated with the other prong (6) of the forked element and can be moved manually between a clamping position in which they prevent the disengagement of the conical surfaces and a release position for enabling such disengagement in order to facilitate the quick removal and refitting of the door.
