Abstract (en)

[origin: EP0398106A2] In a device for operating pivotable and/or displaceable body parts on motor vehicles, with a grip part movable through an orifice in the body part between two end positions and lockable in the end positions, with a cover part closing the orifice of the body part in a first end position of the grip part, and with a drive for moving the grip part and cover part, which is controllable by a lock of the motor vehicle, the grip part and cover part are designed separately from one another and, when they move, the grip part and cover part describe different paths of movement. The purpose of this is to provide a device in which the grip part is protected against dirt and moisture better than in the prior art and which makes it possible to have an orifice in the body part which is smaller than that of the prior art. <IMAGE>
