Abstract (en)  
[origin: EP0398349A2] A device is disclosed for automatic taking-out of articles, in particular of containers from a roller conveyor. The device contains a pivotable rocker which, at its discharge end, carries a stop device for the containers situated on the roller conveyor. Arranged at the other end of the rocker is an overrun device which, in the unpivoted state of the rocker, lies under the conveying plane of the roller conveyor. As a result of the pivoting of the rocker, the stop device is lowered and the front container can be removed from the roller conveyor, while the subsequent container can be prevented from further movement by the overrun device. After the removal of the container, the rocker pivots back into the initial position and the subsequent container is conveyed on to the stop device at the end of the roller conveyor. <IMAGE>
