Abstract (en)  
[origin: EP0398401A1] The invention relates to an installation for preparing and transporting mortar on a building site, said installation being provided with a mixing device for mixing cement and sand, with a mortar conveying device comprising a compressor installation and with a transportable silo for the storage and/or transport of cement and sand. The silo is provided with at least one pair of separate compartments, one compartment being intended for accommodating sand and one for accommodating cement. The compartments are at their bottom sides provided with outlets which can be closed by way of closing means. The two outlets of the compartments of the silo open into the upper ends of a pair of separate measuring rooms (10,1'), having a certain volume and which are likewise provided with openings at their lower ends, which openings can be closed by closing means. The closing means are adjustable by means of pneumatically operating driving means (9,13), which are connected to the compressor installation of the mortar transporting device for being supplied with pressurized air.
