Abstract (en)

The device comprises: a metal part (4) provided with a tubular appendage (7); a connecting element (8); and an insulating central body (10) placed between the abovementioned metal part (4) and the connecting element (8). The insulating central body (10) comprises a radial passage (11) suitable for receiving one end (12) of the stripped core of the coaxial cable and a housing (13) into which the passage (11) emerges; the abovementioned connecting element (8) comprises a portion suitable for engaging in the housing (13) and for causing the bending of the end (12) of the core of the coaxial cable and the gripping of this end folded over against the surface of the central body so as to establish the electrical linkage between this core and the said connecting element (8). <IMAGE>
