Abstract (en)
Cathodic protection is provided to a subterranean pipe (1) by the known method of making a small (non-man-entry) excavation to expose the top surface of the pipe, descaling and/or abrading the exposed pipe surface using tools (T1, T2) working from ground level (10), fixing an electrical conductor to the prepared pipe surface and connecting the conductor to a sacrificial anode. The invention is concerned with the provision of a liner sleeve (3) in the excavation, having near its lower end a transverse member (4) with an aperture (6) which locates and guides the tools. The vertical position of the member (4) can be adjusted.
