Abstract (en)

[origin: EP0399178A1] The invention is based on a radiant heater for cookers with a radiant heating member (6) between a support plane (3) for items to be cooked and a reflector (12). In a known manner, such reflectors (12) are to have as low an absorption capacity and as high a reflection capacity for thermal radiation as possible. According to the invention, the output of thermal energy, which is active on the item to be cooked (4) and originates from the radiant heating member (6), is increased in that the reflector (12) has small thermal mass and good absorption properties in relation to thermal radiation. <IMAGE>
