Abstract (en)
[origin: EP0399237A2] The dental appliance is provided with a bore which extends from a side surface of the dental appliance in the direction of a tooth stump. The bore preferably has an oval cross-section and has its opening on the inner side of the tooth (palatinal or lingual). The bore runs either between the occlusion surface of the dental appliance and the tooth stump, or it ends on a side surface of the tooth stump. An instrument for removing a dental appliance connected to the tooth stump comprises an end-piece provided with an edge which can be supported on the tooth stump and with a surface area which can be made to bear, in the region of the bore, on surfaces of the dental appliance. <IMAGE>
