Abstract (en)

[origin: EP0399488A2] In a sleeve-shaped winding core for thin, web-shaped winding material, in order to simplify the fixing of one end of the winding material to the winding core, an adhesive layer (12) of a permanent adhesive is first applied to the winding core, which is formed from numerous paper or cardboard webs. A strip-shaped top web (13) of, for example, paper or cardboard is then wound helically onto this adhesive layer (12), the longitudinal edges (14) of this top web (13) being kept at a specific distance apart. As a result, a helical strip (15) of adhesive layer remains free on the outside, is arranged in a recessed manner relative to the top web (13), and serves to fix the end of the winding material to the winding core (9).
