Abstract (en)

The present invention relates to a vibrating machine, particularly for the surface finishing of parts, with automatic unloading means, which comprises a tank body (1) provided with vibration means and connected to a supporting frame (2) with the interposition of anti-vibration means. The tank body (1) is provided with an internal bottom (3) which defines a ramp-like portion (4) for sending the parts toward an unloading plane (5) by means of a connecting wing (6) associated with the unloading plane (5) and removably associable with said ramp-like portion (4) for the extraction of the finished parts. The peculiarity of the invention resides in the fact that it comprises a lower detector (12) of the positioning of the wing (6) in lowered position on the ramp-like portion (4) and at least one intervention timer which controls the time of passage of the connecting wing (6) from the raised position to the lowered position and drives the actuation of motor means (10) for moving the connecting wing.
