Abstract (en)

[origin: EP0400567A2] The invention relates to a device for coating the interior of hollow bodies (8) such as tubes, cans and the like, having a transport chain with rotatable receptacle cases (3) for the hollow bodies (8), the transport chain (2) being guided at the coating point about a wheel (1) to which a lifting carriage (5), which if appropriate also makes oscillating movements, having coating units (7) attached thereto by means of holders (6) is assigned and having a drive (9). According to the invention, the lifting movement of the lifting carriage (5) occurs by means of an additional controllable separate drive. The additional controllable separate drive can be a position-controlled direct drive or a position-controlled drive (11), in the latter case the lifting movements of the lifting carriage (5) being transmitted by means of a gearing with constant transmission ratio. <IMAGE>
