Abstract (en)

Device for attaching (1) a load to a cable (22) or any other elongated element comprising a first and a second coaxial wheel having star-shaped branches (5, 6) and a skate (9) which is mounted on the branches of the wheels in such a way that the latter can turn with respect to the skate, the cable (22) being intended to pass between the wheels (2, 3) and under the skate (9). The space (28) between two of the branches of the first wheel (2) is shaped such that, when the cable (22), arranged between the wheels, is engaged laterally in this shaped space (28), the skate (9) can pass above the cable (22) crossing this shaped space (28) in such a way as to be able to couple or decouple the cable (22) and the device (1). <IMAGE>
