Abstract (en)  
[origin: EP0401202A2] In a clamp fastening (1) for ski boots having a tightener (2) which can be swivelled transversely to the tensioning direction and can be connected to a tensioning member (11) so as to be longitudinally adjustable by means of an intermediate piece (12), the intermediate piece (12) is connected to the tightener (2) so as to be displaceable in the tensioning direction (16) and, in a first position, is guided so that it can be locked detachably to the tightener (2) and, in the unlocked position, is guided so as to be displaceable to a limited extent in the direction of an extended effective length of the clamp fastener (1), thereby allowing tension relief to be achieved to a certain extent without opening the tensioning lever. <IMAGE>
