Abstract (en)

[origin: EP0401543A1] The invention relates to a heat exchanger apparatus with at least one outer pipe (80) carrying a first heat exchange medium, in which outer pipe there extends at least one inner pipe (82) of lesser diameter for a second heat exchange medium. It is proposed that, in order for the inner pipe (82) to be supported without play, the outer pipe (81) be provided with inward-directed local projections (88) which press the inner pipe (82) against the inside wall of the outer pipe (80) or against other inward-directed projections of the outer pipe. <IMAGE>
