Abstract (en)

[origin: EP0401828A1] A roving bobbin carrier system for conveying roving bobbins between a fine spinning frame (5) and a roving frame (R) in a spinning mill. A suction nozzle type residual roving removing device (50) and a backup device (100) are provided in series in a return line (2) for returning the roving bobbins on which a residual roving is possibly attached from the fine spinning frame to the roving frame or in a stock line connected to the return line. Accordingly, blank bobbins having no residual roving can be efficiently supplied to the roving frame, and the removal of the residual roving can be full automated.
