Abstract (en)

The device has as its object a data management system, relating to security, based on criteria of distributed intelligence, characterized in that it comprises a plurality of sensor units (1), each able to manage specific sensors of the seismic, microphone, thermal type and to perform a series of local activities. Said plurality of sensor units is connected to a main loop (2), able to verify and organize the data received from the individual sensor units, in a file. Further, a concentrator (3) is provided, able to access the data stored in the main loop and to make a comparison between the data and its own logic maps, the concentrator communicates with a computer (4), at the central level, using the data networks existing in the banking institutions.
