Abstract (en)

[origin: EP0402624A2] Anchored in cylindrical location bores of the drill head (10) are at least two carbide pins (11') which project radially beyond the adjacent circumferential surface (10a) of the drill head (10). The carbide pins (11') have a polygonal cross-sectional profile. They are centred on the inner circumferential surface of their location bore (12) by means of their longitudinal edges (11a). The rotational resistance which the drill bit has to overcome during the drilling work is thereby reduced. At the same time, increased drilling advance can be noted. On the other hand, the risk of the carbide pins (11') fracturing in the wake of the rhythmic axial blows is reduced. <IMAGE>
