Abstract (en)

[origin: EP0403774A1] In order to mount a turn-and-tilt wing (1) with a wing overlap (21) by means of a fitting accommodated in a completely concealed manner in the rebate space between the wing and fixed frame (2), the pivot pin (3) of the wing must be capable, during, opening by turning, of executing a movement transverse relative to the plane of the fixed frame (2). It is consequently located, for example, on a link (11) of an X-type scissor mechanism (8 or 9) in each case. An especially high wing weight is possible if supporting and guiding functions in the tilting scissor mechanism are separated from one another and if the wing weight is transferred via a supporting arm to the fixed frame. <IMAGE>
