Abstract (en)

[origin: EP0403868A2] A lockable window grip (10) has as a lock a spring-loaded profile cylinder (60) in a grip head (14) which is mounted on a stop plate (40) axially fixedly, but rotatably. Supported resiliently on it or on a cover plate (48) is a locking piece (58), in particular a rotationally symmetrical claw ring. A flanged bush (22) is integral with a cap plate (24) having a receptacle (30), inclined at the angle (α), for the lock detent member (70) which, for example, is a slide guided slideably in the grip head (14) and possessing two legs (26) with oblique press-down ends (78) on both sides of a collar (72). A U- shaped retaining spring (64) is supported on a slope (34) of the cap plate (24) which has a projection (84) for a lock-actuable spring element (90) and inside which the locking piece (38) can slide on a spacer ring (36). The lock (60) is vertically displaceable and fixable in the grip head (14) at its angle of inclination (α) relative to the axis of rotation (A), its outer face being approximately flush with the inclined grip-head cover surface (16) in the locked state. <IMAGE>
