Abstract (en)  
[origin: EP0403886A1] Printed products (13) are fed by means of a conveyor belt (11, 14) to a stacking shaft (17), which can be charged from above, in a scale formation of the type in which the printed products (13) lie flush one upon the other in pairs. In order to be able to form a stack containing an odd number of printed products, a retaining device (24) is provided adjacent to the outlet from the conveyor belt (11, 14) and, when activated, temporarily lifts the upper printed product (13) from the printed product lying beneath. <IMAGE>
